PREFACE

THESE experimental proofs (or more properly *verifications*) of quantitative laws were undertaken by pupils after the qualitative composition of the principal substances employed had been carefully dealt with in the accompanying lecture course.

Practical Physics went on side by side with the practical chemistry course.

The pupils whose results are quoted in the text were mostly between twelve and eighteen years of age. A book of results was kept so that each pupil could compare his results with others obtained under similar conditions.

The pupils had $1\frac{1}{2}$ hour at a time in the laboratory, and attended twice a week.

66493

I have not been satisfied with quantitative experiments unless they yield good results in the hands, not only of the teacher but of the pupils. The results quoted in the text are those obtained by the pupils.

I am not aware that a satisfactory standard as to the accuracy required for such experiments has yet been laid down. Within 1 per cent. is certainly sufficient, but the standard may vary to some extent according to the nature of the law or problem investigated.

Perhaps the standard is best determined by historical considerations, for the history of a science is recapitulated by the learner. If the pupil can verify a law to such a degree of approximation as first served to convince the scientific world of its truth, he may generally be satisfied with his work. I have quoted in the text the results of early historic experiments side by side with those obtained by pupils. Although in these early experiments the error is often large, yet there is less difference than the learner may have supposed

between the accuracy of the *first approximations* which have obtained the provisional assent of the scientific world at the beginning and towards the end of the nineteenth century, respectively.

As far as possible no numerical data, whether chemical or physical, were *assumed*. The density of hydrogen and the proportion by weight in which hydrogen and oxygen combine are neither assumed nor determined in these experimental verifications of the Laws of Combining Proportions. It is not *necessary* that equivalent weights should be referred to that of hydrogen, and the experiments cannot be done with the same accuracy as is attainable in the case of other elements.

The use of atomic and molecular formulæ is inadmissible in an examination of the facts upon which the atomic and molecular theory is based. Chemical equations and formulæ have therefore been excluded.

The course is, I believe, suitable for first-year's students at colleges as well as for the upper forms of schools.

I have to acknowledge valuable suggestions received from other chemists while this course was in preparation. My thanks are due more particularly to Dr. J. B. COHEN, of the Yorkshire College, Leeds, and to Mr. G. STALLARD, of Rugby.

VAUGHAN CORNISH.

August 1895.

CONTENTS

CHAPTER I

	PAGE
STATEMENT OF DALTON'S ATOMIC THEORY AND OF THE LAWS OF COMBINING PROPORTIONS .	1

CHAPTER II

THE LAW OF CONSERVATION OF MASS

EXERCISE I.—The Use of the Balance	6
EXERCISE II.—The Complete Synthesis of Silver Sulphide .	10
Calculation and Statement of Results	13
Note upon early Experiments relating to this Law, and upon Stas' Determinations	15

CHAPTER III

THE FIRST PART OF THE LAW OF DEFINITE AND OF CONSTANT PROPORTIONS

Deductions, bearing upon this Law, from Exercise II.	17
EXERCISE III.—The Determination of the Proportion by Weight in which Silver and Chlorine combine when Chlorine Gas acts upon Silver	19
EXERCISE IV.—The Determination of the Proportion by Weight in which Silver and Chlorine combine when a solution of Hydrochloric Acid acts upon a solution of Silver Nitrate	22
